Attempt : 1
Total Mark : 10
Marks Obtained : 10

Section 1 : COD

1. Problem Statement

In a ticket reservation system, you store the available seat numbers in a TreeSet. Users input their desired seat number, and the program checks whether the chosen seat is available.

Using a TreeSet ensures quick and efficient verification of seat availability, ensuring a smooth and organized ticket booking process.

Input Format

The first line of input contains a single integer n, representing the number of available seats.

The second line contains n space-separated integers, representing the available seat numbers.

The third line contains an integer m, representing the seat number that needs to be searched.

Output Format

The output displays "[m] is present!" if the given seat is available. Otherwise, it displays "[m] is not present!"

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 4

2 4 5 6

5

Output: 5 is present!

Answer

```
import java.util.*;  
  
public class Main {  
    public static void main(String[] args) {  
        Scanner sc = new Scanner(System.in);  
  
        int n = sc.nextInt();  
  
        TreeSet<Integer> seats = new TreeSet<>();  
  
        // Reading n seat numbers  
        for (int i = 0; i < n; i++) {  
            seats.add(sc.nextInt());  
        }  
  
        // Seat number to search  
        int m = sc.nextInt();  
  
        // Check and print result  
        if (seats.contains(m)) {  
            System.out.println(m + " is present!");  
        } else {
```

```
        } } System.out.println(m + " is not present!");  
    } }
```

Status : Correct
